Customer Reviews

This atlas represents a comprehensive compilation of cross-sectional (computed tomography, CT, and magnetic resonance, MR) images of normal anatomy and a wide range of pathologic conditions in dogs and cats. The book is logically structured into 6 sections (head and neck, brain, spine, thorax, abdomen and musculoskeletal system). A brief introduction and literature review at the beginning of each chapter provides an excellent and concise overview over relevant normal findings, anatomic variations, and pathologic lesions to be covered in the following imaging part. Multiple images are provided for each topic, often including both CT and MR images in various

window settings and sequences, multiplanar reconstructions and 3-D volume rendered images of the same animal. Additionally, in many instances endoscopic, intra-operative or gross pathology images are provided along with CT and MR images of a given case, allowing clinical correlation. This is certainly the most comprehensive collection of normal and abnormal CT and MR images in small animal veterinary patients available to date. It does not only include examples of common diseases (e.g., nasal carcinoma or pituitary carcinoma) but also uncommon conditions cross sectional images of which are not easily found in the existing literature (e.g., effects of radiation on the brain or renal secondary parathyroidism). The book is beautifully produced, easy to follow, and the image quality is simply outstanding. Another review mentioned problems with the spine/binding - My copy is flawless, so I did not have the same experience.
