The argument "diagnosis/no diagnosis" should be over with by now. A patient may be treated in a community mental health setting, then in a hospital, then elsewhere. The referring clinician needs to provide information about her difficulty, and diagnosis is a concise and helpful way of doing this. Her care will be paid for by an insurance company or a government entity, which usually (whether we like it or not) will ask for a number to ensure they have a disease that "meets criteria." Careful training in diagnosis is needed to ensure health professionals don't have a cavalier attitude towards the diagnoses they provide; but simply sticking to the criteria outlined in the IV-TR helps ward off such lack of carefulness. It also helps make it more likely that Dr. X in San Francisco is talking about the same thing when he says "schizophrenia, paranoid type" as Dr. Y in Virginia Beach when he says "schizophrenia, paranoid type." Such reliability is essential in our continued research on mental illness and substance abuse. That said, a clinician in a hospital or clinic setting who needs to

understand or determine diagnosis can benefit from both the hardcover versions of the DSM-IV-TR and this spiral bound version. I myself have the hardbound DSM-IV, and instead of purchasing both TR's, simply purchased the spiral-bound DSM-IV-TR. The spiral bound is essential because, with so much use, a glued binding will quickly fall apart. As a clinician currently assigned to a county hospital screening site, I carry my little spiral book everywhere. It fits easily into my purse, but it's not so small that the print is hard to read. There is even a pull-out of all the diagnoses at the beginning that's handy to glance at or tack on the wall.
