Supramolecular Chemistry: Concepts And Perspectives

Synopsis

Supramolecular chemistry is a central theme not only in chemistry, but in neighboring disciplines including physics and the biological sciences. The author has introduced this notion and has been awarded the Nobel Prize for his achievements in this area. He presents here the concepts, lines of development and perspectives of this highly interdisciplinary and burgeoning field of research.

Topics include: - molecular recognition - catalysis and transport processes - molecular and supramolecular devices - self-processes By placing the basic concepts into a broader perspective, the author succeeds in inspiring, stimulating and challenging the creative imagination of his reader.

Customer Reviews

When I first got into the world of supramolecular chemistry I didn't know where to start, where to gather a general view of the topics. I also wanted to search some interesting examples in the literature. This book helped me achieve these in a very short time. The subjects are up-to-date and the examples given in the text are really impressing. I had the book from our school library and hope to have one to my own- as a guide all the time..

A very well written book, specially for someone who does not have a lot of knowledge on this new field

Love this book, learned so much. Started off as a novice but now I feel confident.
